

Data Recovery

```
root@kali:~/Desktop# mmls -t dos dfr-11-mft-ntfs.dd
DOS Partition Table
Offset Sector: 0
Units are in 512-byte sectors
```

	Slot	Start	End	Length	Description
000:	Meta	0000000000	0000000000	0000000001	Primary Table (#0)
001:	-----	0000000000	0000000127	0000000128	Unallocated
002:	000:000	0000000128	0002091135	0002091008	NTFS / exFAT (0x07)
003:	-----	0002091136	0002097152	0000006017	Unallocated

1) Use mmls command to display the layout of the image. We can see there is only one partition in the image while start sector is 128 and end at 2091135 the length is 2091008.

```
root@kali:~/Desktop# dclff if=dfr-11-mft-ntfs.dd bs=512 skip=128 count=2091008 of=ntfs.dd
bash: dclff: command not found
```

2) We capture the partition from 128 to 2091135

```

root@kali:~/Desktop# fsstat -f ntfs ntfs.dd

```

3)fsstat command get the information of the image

```

FLS(1)                                     General Commands Manual                                     FLS(1)

NAME
    fls - List file and directory names in a disk image.

SYNOPSIS
    fls [-addFlpruvV] [-m mnt] [-z zone] [-f fstype] [-s seconds] [-i imgtype] [-o imgoffset] [-b dev_sector_size] image [images] [ inode ]

DESCRIPTION
    fls lists the files and directory names in the image and can display file names of recently deleted files for the directory using the given inode. If the in-
    ode argument is not given, the inode value for the root directory is used. For example, on an NTFS file system it would be 5 and on a Ext3 file system it
    would be 2.

```

4) Because we don't know which file has been delete so that we can not recover it. Therefore, fls command help us to identify which file has recently been deleted.

```

root@kali:~/Desktop# fls -r ntfs.dd

+ -/r * 42-128-1:   Vega.txt
+ -/r * 43-128-1:   Sulafat.txt
V/V 64: $OrphanFiles

```

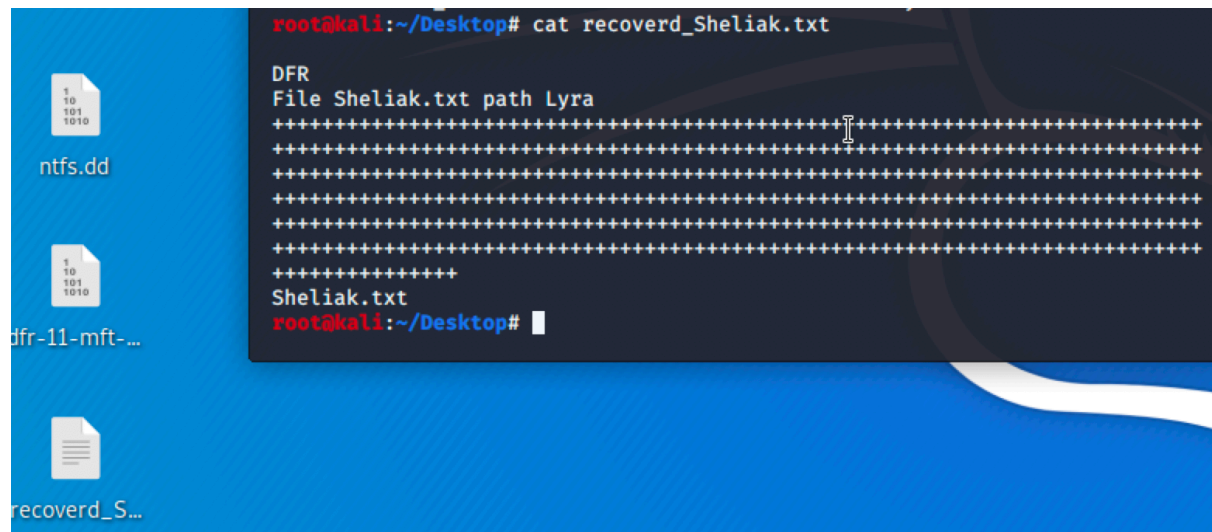

5) This represents all the files

```
root@kali:~/Desktop# fls -r -d ntfs.dd
d/- * 0:      Orion
-/d * 36-144-1: Lyra
-/r * 41-128-1: Lyra/Sheliak.txt
-/r * 42-128-1: Lyra/Vega.txt
-/r * 43-128-1: Lyra/Sulafat.txt
```

6) by using -d, we can find the one have been deleted

```
root@kali:~/Desktop# icat -r ntfs.dd 41 > recoverd_Sheliak.txt
```

7) icat command is used to recover the deleted file while -r mean using the recovery technic.

8) Successful, the file will store in your desktop which you can read it.
